A network of cross-country transmission is critical to minimizing cost

# MIT Study - Value of Transmission for Decarbonization

- What is the value of coordination within regions, between regions and nationally?
- Co-optimized capacity expansion and dispatch model with 7 years of hourly weather
- Least-cost plan results in nearly double today's transmission system (in MW-miles) with 40 GW transfers between east and west and 70 GW between ERCOT and east
- Finds that an “every state for itself” approach has a levelized capital and O&M cost of \$135/MWh and that this cost can be reduced by 46% (to \$73/MWh) with inter-regional coordination and transmission expansion

## Inter-state transmission

None

+ Existing regional

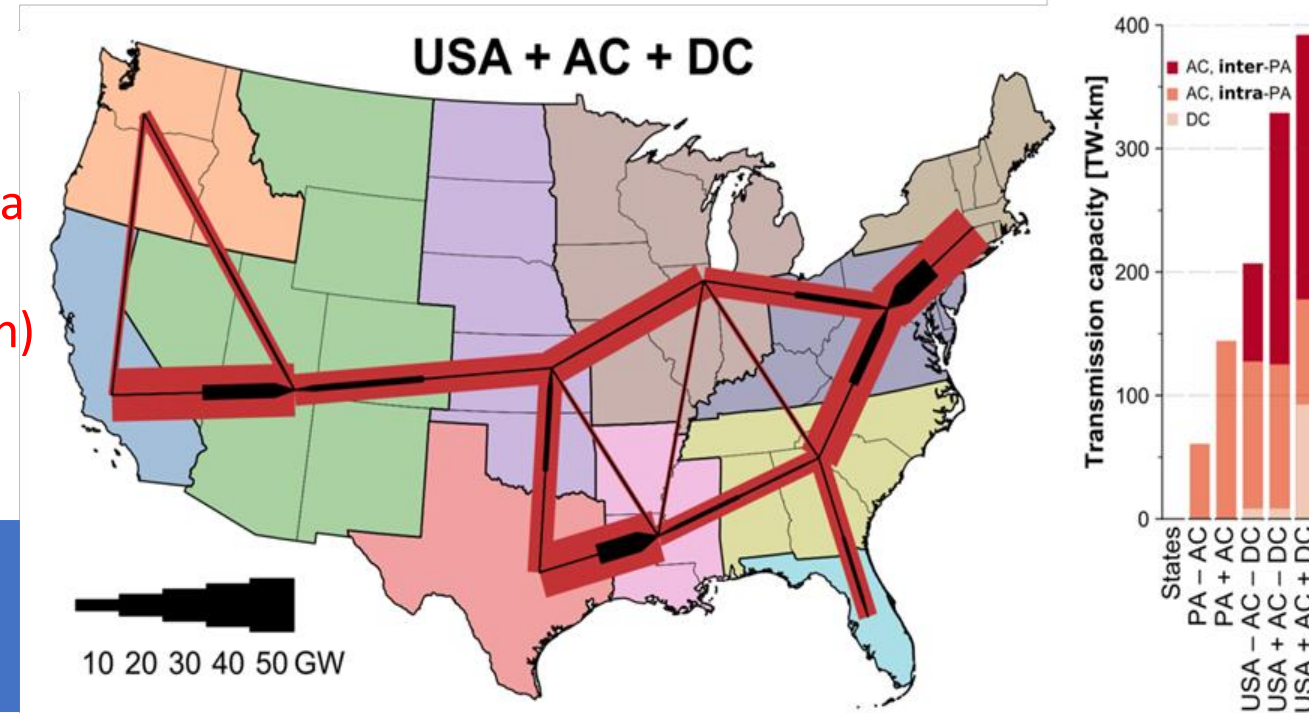

+ New regional

+ Existing inter-regional

+ New inter-regional within interconnects

+ New inter-regional across interconnects

Zero-carbon electricity cost [\$/MWh]

Energy Systems Integration Group

Charting the Future of Energy Systems Integration and Operations

Transmission is not just about  
delivering resources to load

# Transmission contributes to resource adequacy

Transmission smooths all time scales of weather variability

Source: Enernex, EWITS, NREL/SR-550-47078, 2010; L. Nickell, SPP, CREPC Spring meeting, 2017

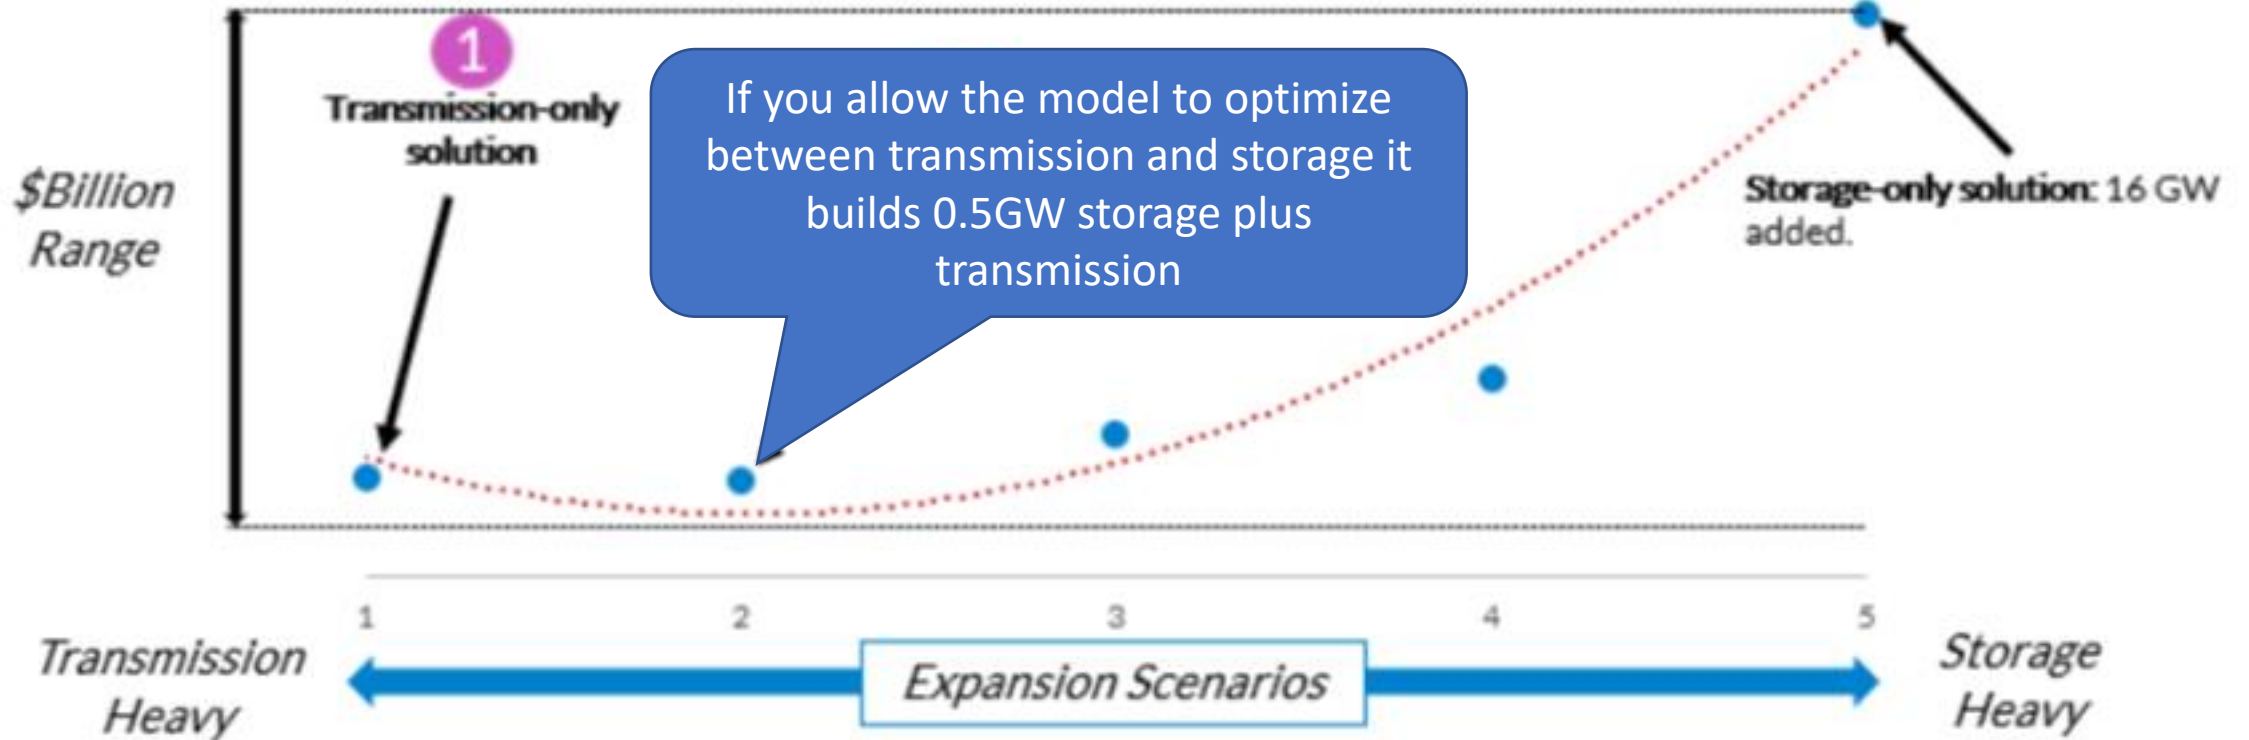

Can't we do this with storage?

# Storage-only solutions are more expensive and don't address all the issues

If you allow the model to optimize size of storage only, it builds 16GW storage

### Total Transmission, Storage and Production Cost

Note: Expansion simulation performed for 40% milestone with all 30% and prior transmission solutions included.

<https://cdn.misoenergy.org/RIIA%20Summary%20Report520051.pdf>

Can't we do this with DERs?

# You need transmission even with high levels of DERs

- Optimizing G, T&D saves money vs not including distribution in optimization
- Benefits are even bigger if you have clean energy goals - save \$473B by optimizing G, T&D
- Optimizing G, T&D builds more DERs and **also builds more transmission**

[https://www.vibrantcleanenergy.com/wp-content/uploads/2020/12/WhvDERs\\_TR\\_Final.pdf](https://www.vibrantcleanenergy.com/wp-content/uploads/2020/12/WhvDERs_TR_Final.pdf)

Managing distribution will be critical as we electrify

*Charting the Future of Energy Systems Integration and Operations*

# Transmission costs are **tiny** compared to other clean resources/infrastructure

# A National Approach to Transmission

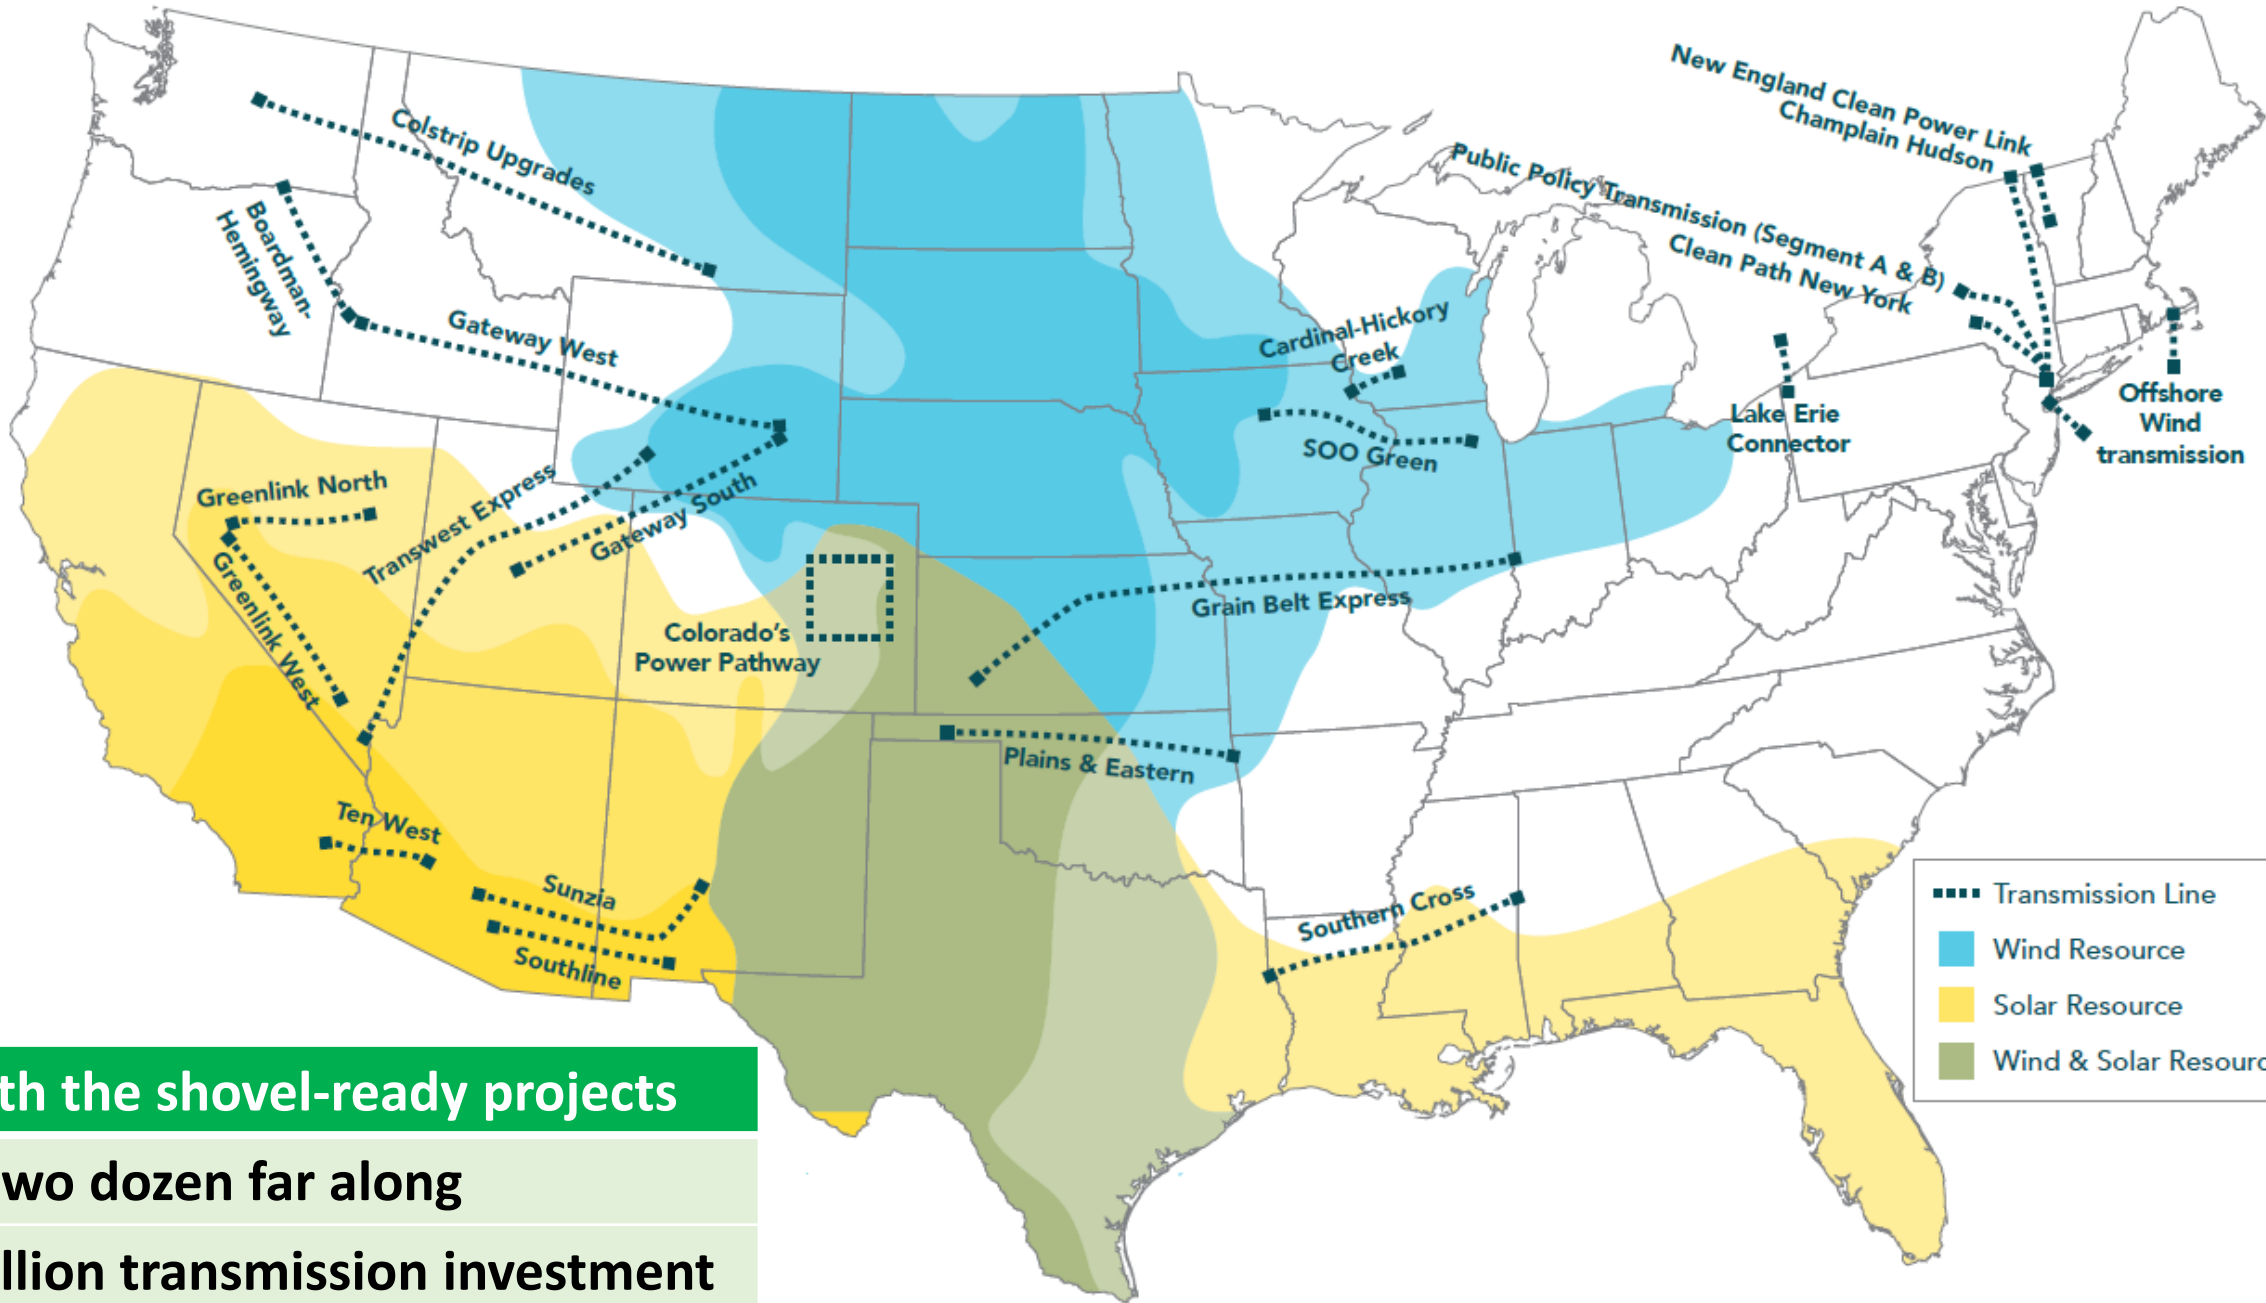

If you want to go to the moon you need a space program.  
If you want to decarbonize the economy you need a transmission plan.

# National Planning Process

- Conduct regular, on-going planning activities
- Include comprehensive engineering and economic analysis
- Leverage national and regional capabilities
- Include regional planners, utilities, and governments
- Result in the construction of **multi-regional** transmission

**Start with the shovel-ready projects**

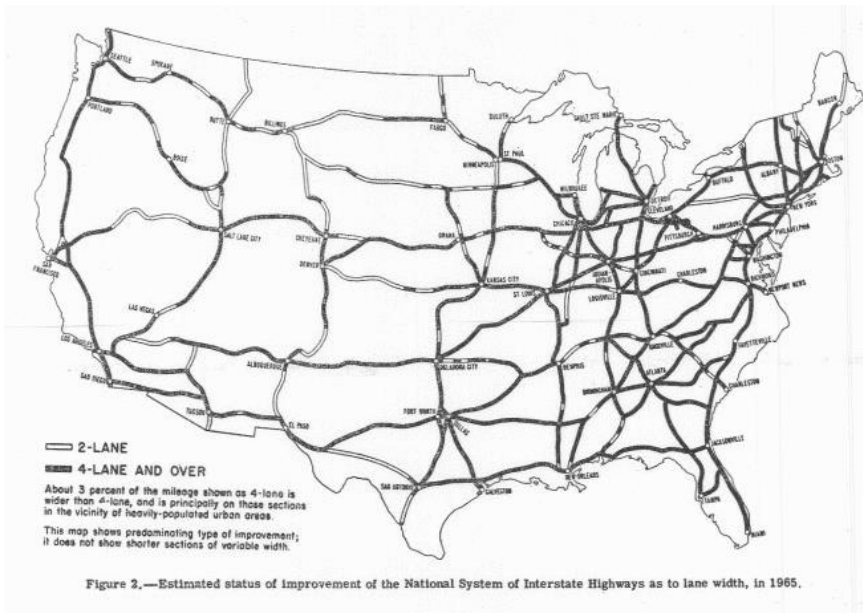

**Nearly two dozen far along**

**\$33.3 billion transmission investment**

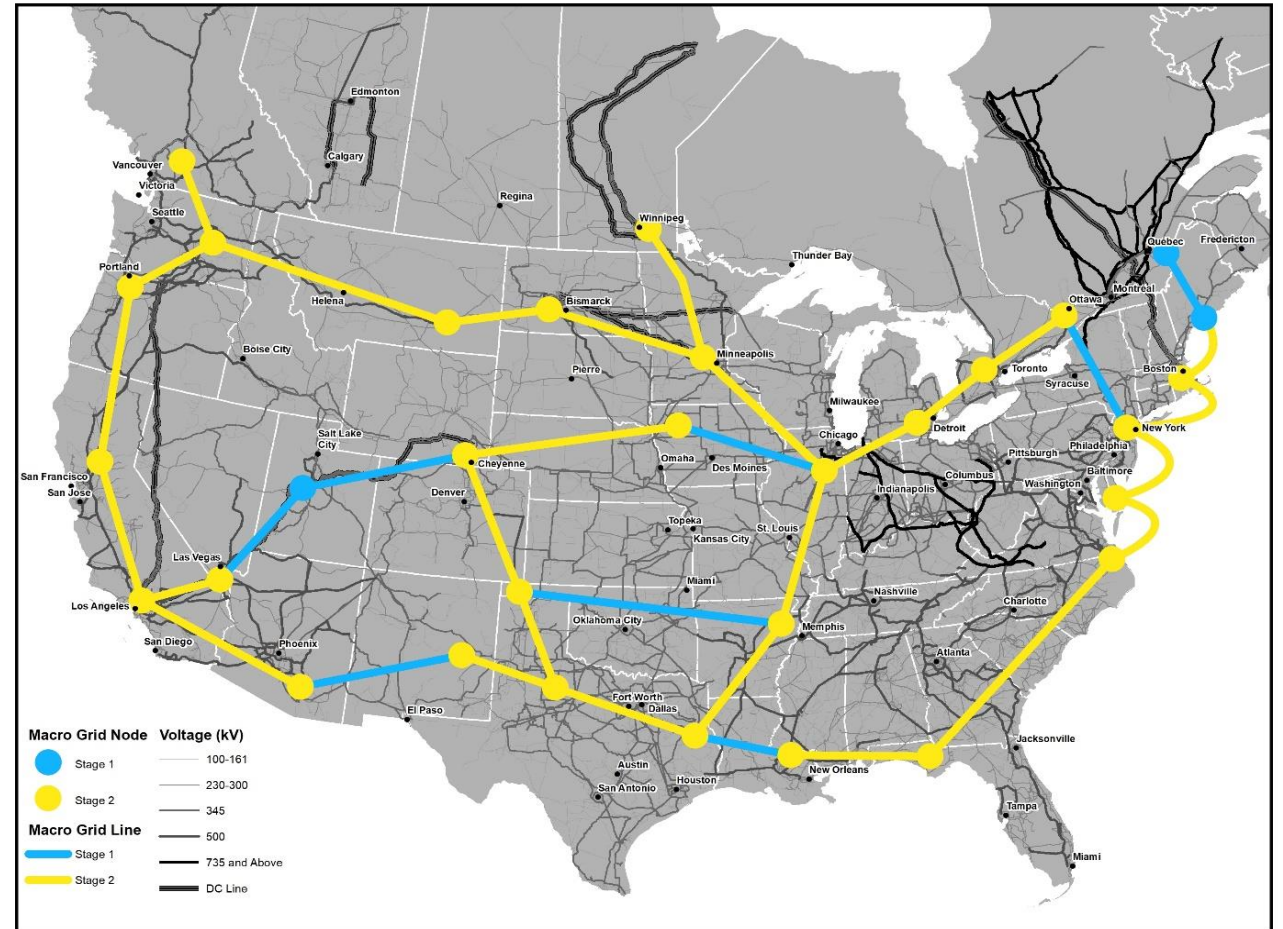

**60,000 MW new renewable capacity**

# Design a national macro grid

Build in stages and start planning now

# Wind and solar generation must grow exponentially

- We may need 1 TW or more of new wind and PV capacity to reach 100% clean electricity goals (that's 5x current wind/PV capacity)
- Decarbonizing the entire US energy economy may require twice that.

HVDC to mitigate weak grid issues: transient voltage and small signal stability issues

Synchronous condensers to mitigate reduced inertia: frequency response issues

<https://cdn.misoenergy.org/RIA%20Summary%20Report520051.pdf>

Figure UC-12: Dynamic stability solutions - incremental complexity by technology for each renewable penetration milestone

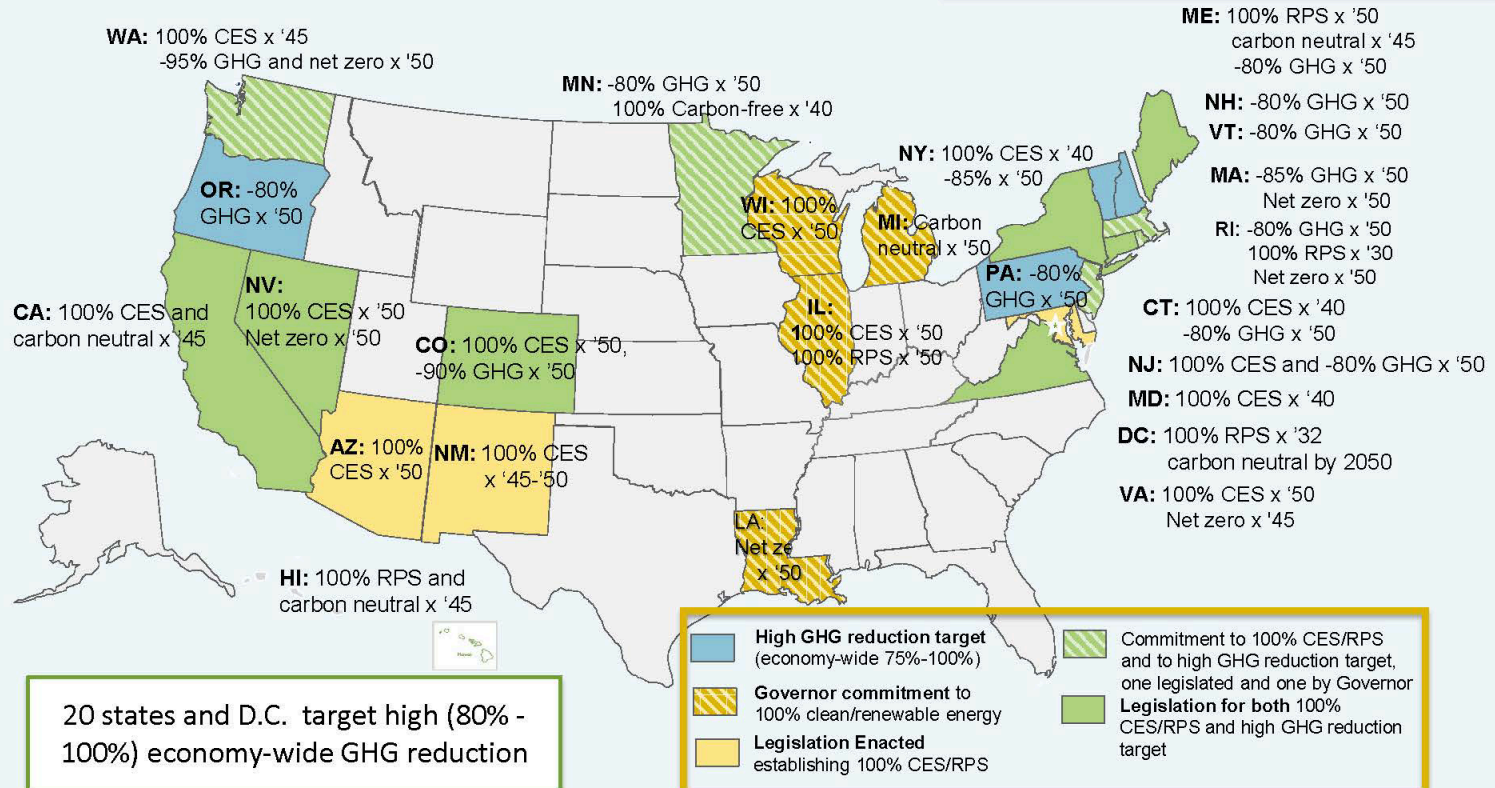

# Principles of a Macro Grid

- Connect regions with diverse load and generation profiles
- Have the lowest cost and smallest footprint possible
- Take advantage of existing surplus transmission capability
- Be tightly integrated yet able to separate safely when necessary
- Have a network of transmission lines to minimize risk of failure
- Be built out in several stages

# Transmission Planning for the Future

## 100% Clean Electricity Standards, 100% RPS, or High GHG Reduction Targets

17 states and the District of Columbia have legislation enacted or Governor commitment to target 100% clean electricity (14) or 100% RPS (3+D.C.)

20 states and D.C. target high (80% - 100%) economy-wide GHG reduction

**24 states and the District of Columbia have 100% clean electricity targets, deep GHG reduction targets, or both, encompassing 53% of US residential electricity customers.**

Rev. August 16, 2021

# What Needs Are We Planning to Meet Today?

---

- Main objective of regional transmission planning processes:
  - Ensure system reliability throughout the planning horizon based on historical usage and conservative future assumptions.
  - Transmission owners discouraged from proactively planning for the future because it involves a degree of risk that the future will be different than expected.
- While Order No. 1000 required regions to consider transmission needs driven by public policy requirements, few regions have been able to reach sufficient consensus to adopt criteria to fully integrate any real public policy drivers.
- Load forecasts do not fully reflect expected electrification trends or the potential for electric storage to change usage patterns.

The transmission planning process can only meet the needs that we ask it to address, and the assumptions and planning criteria that underlie today's regional transmission planning processes primarily focus on maintaining reliability and reducing delivered power costs given the existing resource mix and load forecasts.

# Why Aren't Regions Identifying More Regional Transmission Projects?

---

The lack of regional transmission projects since the issuance of Order No. 1000 is driven by several factors:

## *Limited load growth*

- Load growth has slowed or been nonexistent since the Great Recession, in part due to expanded energy efficiency efforts.
- Load growth has been largely limited to new customer interconnections (e.g., data centers), which do not result in the NERC Reliability Standard violations that would drive a regional need.

## *Modest congestion*

- Due to reduced load growth, low natural gas prices, and an increase in zero marginal cost resources on the system, congestion has fallen as well, limiting the opportunities to identify regional economic projects.

## *Reliance on the generator interconnection process to integrate new resources*

- Generator interconnection processes identify needed network upgrades outside of the regional transmission planning processes.
- As a result, even when large-scale network upgrades are necessary to integrate new resources, they are not categorized as regional transmission projects.

# The Problem: Lack of Proactive Planning to Integrate Clean Energy Resources

---

Today, the transmission infrastructure needed to integrate new clean energy resources is identified primarily through the generator-by-generator interconnection process.

- Individual generators submit requests for interconnection service.
- The transmission owner/provider studies the network upgrades necessary to accommodate those requests on a request-by-request basis.
- Generators are driven to find the lowest-cost network upgrades needed to interconnect.

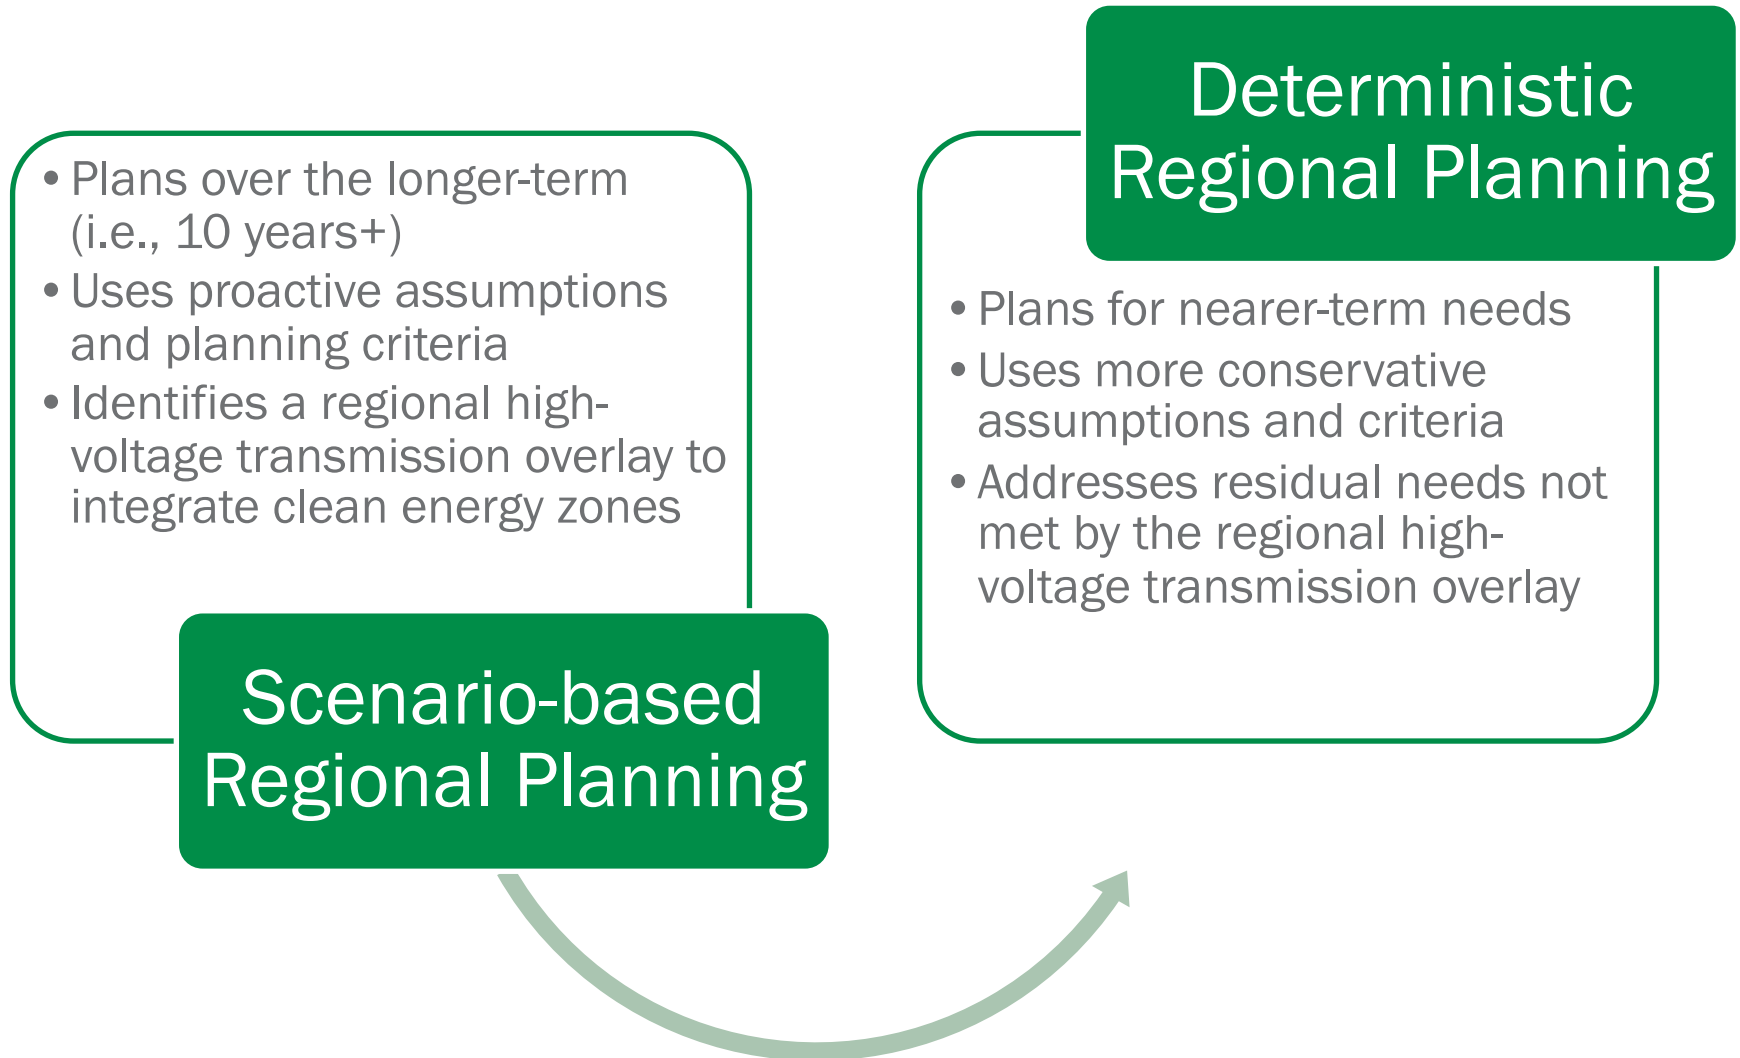

Relying on individual interconnection processes to integrate clean energy resources is inefficient for both generator interconnection customers *and* transmission owners/providers.

- Given current backlogs in the interconnection queue, generators often submit multiple interconnection requests for a single project to determine which location has the lowest network upgrade costs.
- The transmission owner/provider must study each request (no matter how speculative) to identify the associated network upgrades.
- With this information, the generator typically withdraws one or more of its requests, necessitating restudies for resources further behind in the queue.
- Only the minimum infrastructure needed to reliably interconnect the generator is funded.

# A Solution: Robust Scenario-based Integrated with Deterministic Regional Planning

---

# Closing Thoughts

---

- Order No. 1000 provides a strong foundation for more proactive regional transmission planning; with limited revisions to the regional transmission planning and developer requirements, we can better facilitate the clean energy transition.
- Proactive, scenario-based planning will not replace the need for deterministic regional or local transmission planning, although it will help to ensure that those processes focus on addressing residual needs.
